

YB3 HANDHELD TRACKER

A tracker that allows you to track and communicate, via satellite, from anywhere on Earth

The YB3 tracker is a rugged and fully self-contained battery-operated tracker which works anywhere on Earth. The tracker will wake up every so often (e.g. every 15 minutes), obtain a position using the GPS satellite network, and then transmit that position back to YB Tracking HQ using the Iridium satellite network in seconds. The message is relayed to us from Iridium, and then we visualize the positions on an easy-to-use web-based viewer.

The YB3 also allows short messages (like SMS, social media updates and short emails) to be sent using a paired Bluetooth device (such as a smartphone) and the YB Tracking app. This allows for full two-way communication wherever you are, even when out of mobile network range. Iridium is the only satellite network that allows transmission of information from any point on Earth – other networks have no coverage in the polar regions and have intermittent or no coverage in other marine and land areas.

Iridium has 66 satellites in orbit around the Earth, allowing coverage anywhere on Earth 24 hours a day, 7 days a week. No other satellite network has truly global coverage. Messages sent via Iridium take just seconds to reach YB Tracking HQ. Depending how often the YB3 is set to transmit, they can last for up to a year on their internal battery.

KEY FEATURES

- 5-button keypad plus specific 'alert' button
- Bright OLED screen for information display
- Send and receive text-based messages
- Truly global operation, using Iridium satellites
- Waterproof and rugged tough
- Bluetooth LE for advanced messaging
- Long battery life: up to 12 months
- Over-the-air configurations of key parameters
